Ophelia: Week 6, Day 4 - The Four Steps of Training

The Four Steps of Training Tweaking the parameters of a Model based on training data -- in a way that should generalize to unseen data.

1. Forward pass Predict the output given inputs
2. Loss Calculation How different was the prediction to the ground truth
3. Backward pass How should we tweak parameters to do better next time (the "gradients")
4. Optimization Update parameters a tiny step to do better next time

Hyper-parameters You can specify additional Settings that aren't updated during training known as "Hyper-parameters" Like epoch and learning rate.

Code from evaluation import test

```
tests = test.load_tests()

len(tests)

example = tests[0] print(example.question) print(example.category) print(example.reference_answer) print(example.keywords)

from collections import Counter Count = Counter[str]([t.category for t in tests]) Count Counter({'direct_fact': 70, 'temporal': 20, 'spanning': 20, 'comparative': 10, 'numerical': 10, 'relationship': 10, 'holistic': 10}) from evaluation.eval import evaluate_retrieval, evaluate_answer

evaluate_retrieval(example)

eval, answer, chunks = evaluate_answer(example)

eval

print(eval.feedback) print(eval.accuracy) print(eval.completeness) print(eval.relevance)
```
